

Our Services: Design and Fabrication

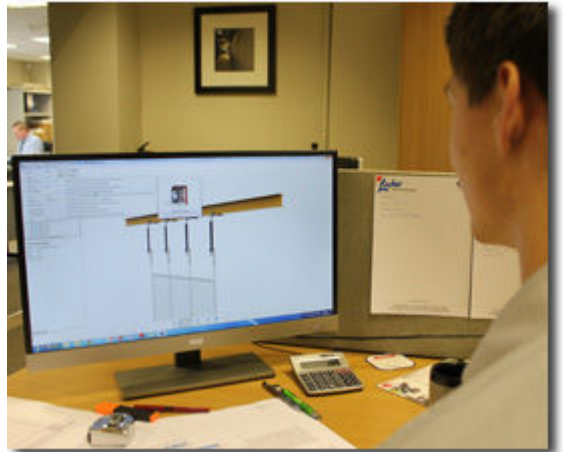

Offshore Heatshield Design

Locker Heatshield Ltd provide a team of experienced creative designers, who bring many years' combined experience in the field of offshore engineering for the oil and gas industry.

We draw on our skills to develop a design brief to budget and timescale of a project while maintaining build and safety standards.

We are able to provide guidance for the design of structural steel work and we will provide full general arrangement and part drawings.

CAD-based analysis and modelling tools allow rapid scheme design and cost information to be understood at an early stage in a project.

Fabrication of Offshore Heatshielding Panels

Fabricating cladding panels for offshore installation is a most demanding requirement which we have been successfully meeting for more than 30 years.

This wealth of experience now enables us to offer unparalleled service in the design and fabrication of heatshielding mesh panels and systems with special edging and frames.

These are formed and assembled to suit all requirements, build and safety standards within the offshore oil and gas industry.

Work on stainless steel is undertaken in quarantined areas.
